Lecture 1: Introduction to Spark and HPC

Shuo Zhou

COM6012: Scalable ML

https://images.techhive.com/images/article/2016/08/thinkstockphotos-462205183-100677632-large.jpg

Week 1 Objectives

- Identify key data types across the **data structure spectrum** and describe the **Extract–Transform–Load** (ETL) process.
- Summarise the challenges of the **big data problem**.
- Explain the **architecture, components, and resource management** of a Spark application, and implement simple PySpark programs.
- Explain the structure of the University's **high-performance computing (HPC) cluster**, and request resources to execute computational tasks.

Contents

- The Big Data Problem: Why Spark?
- What is Spark?: The Essentials
- An Example of Spark: Log Mining
- How to Use Spark: PySpark, HPC, Resources

Check-in code:
XX-XX-XX

Where Does Big Data Come From?

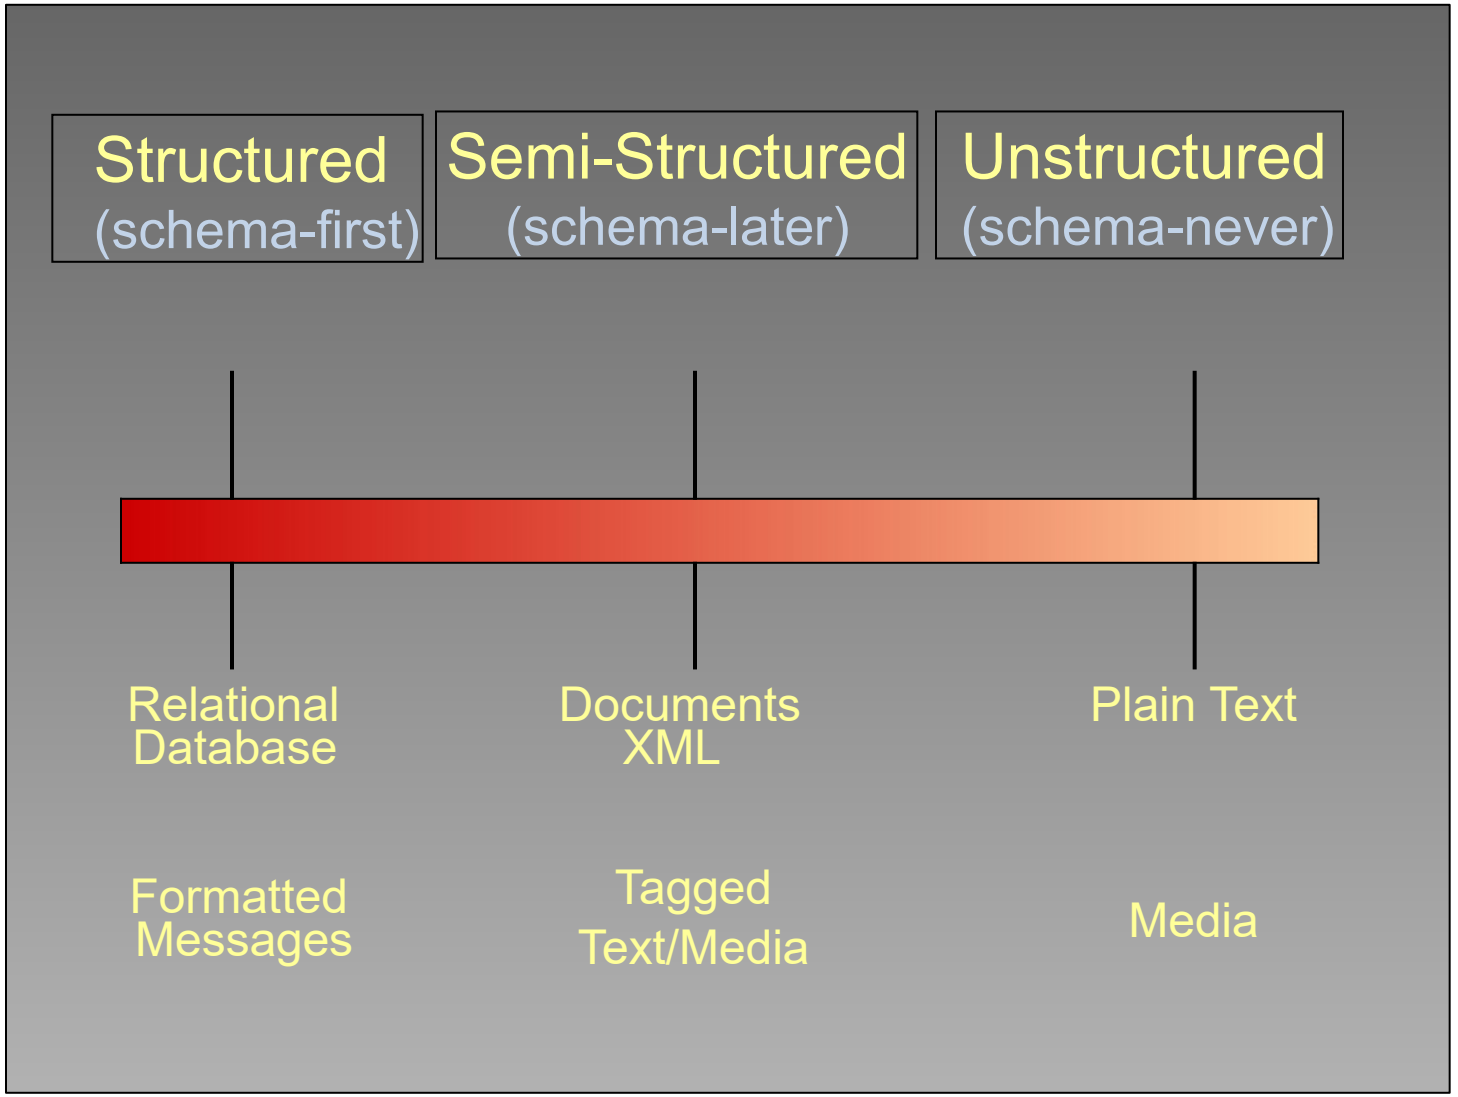
- Online activities:
  - Clicks
  - Billing events
  - Server requests
  - Transactions
  - Network messages
  - Faults
  - …

- Data sharing platforms: web + mobile

Where Does Big Data Come From?

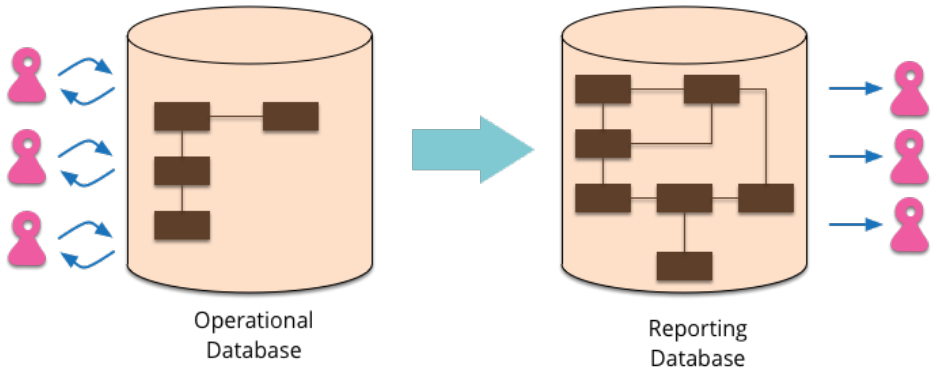
AI generated content

Data Structure Spectrum



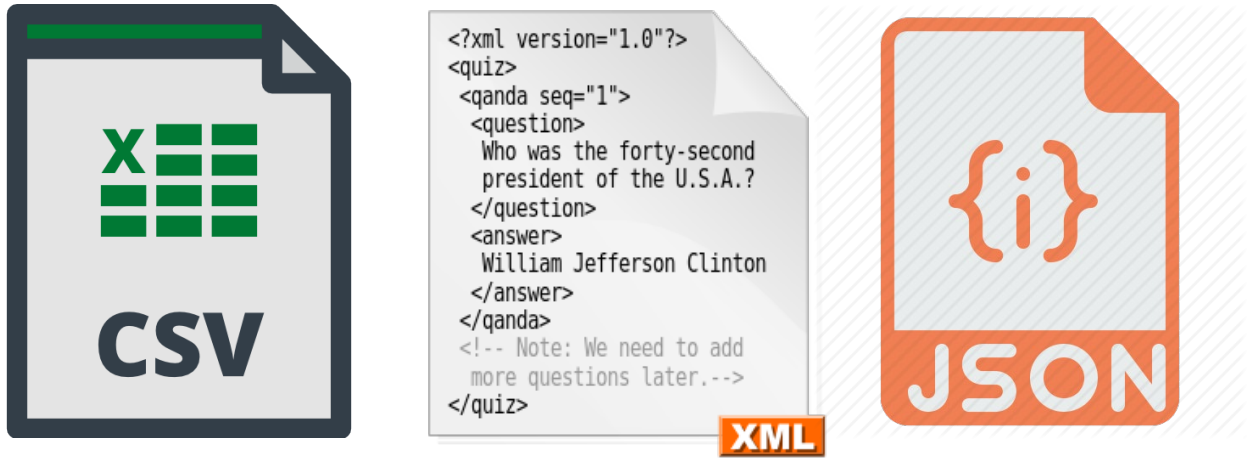
Structured Data

- Database: relational data model → how a database is structured and used
- Schema: the organisation of data as a blueprint of how the database is constructed
  - The programmer must statically specify the schema
- SQL: Structured Query Language



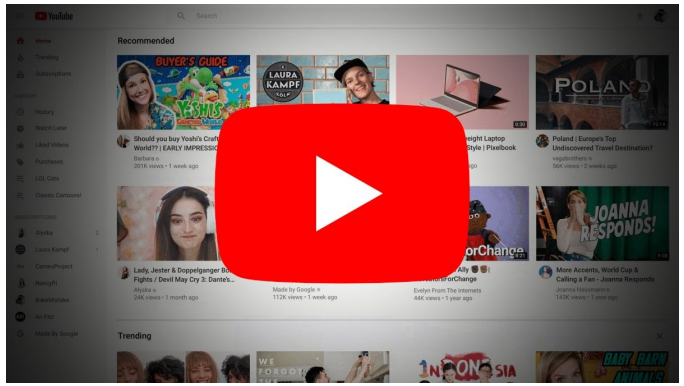
Semi-Structured Data

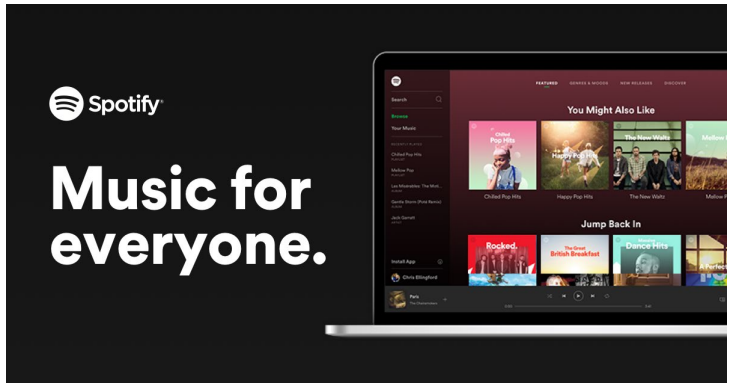
- Self-describing rather than formal structures, tags/markers to separate semantic elements
- The column types → the schema for the data
  - Spark dynamically infers the schema while reading each row
  - Programmer statically specifies the schema
- Examples:

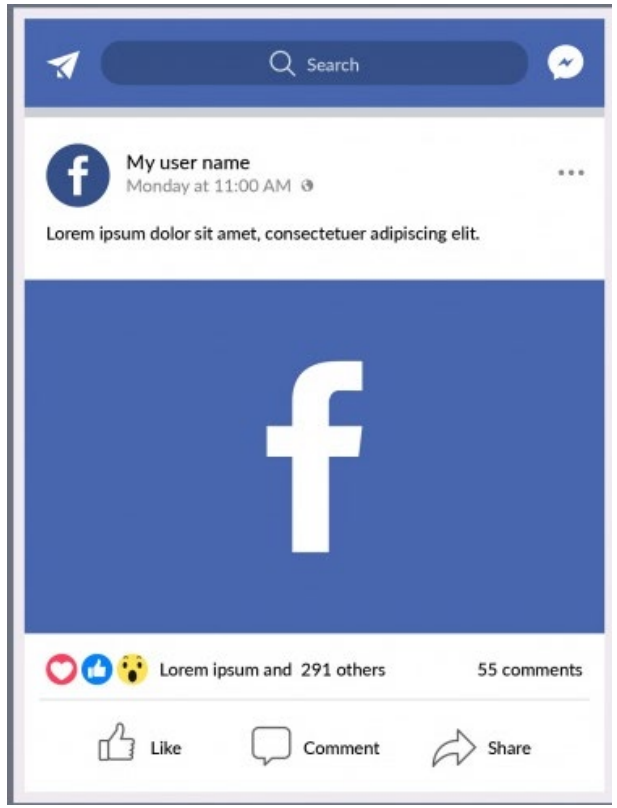


Unstructured Data

- Only one column with string or binary type
- Examples



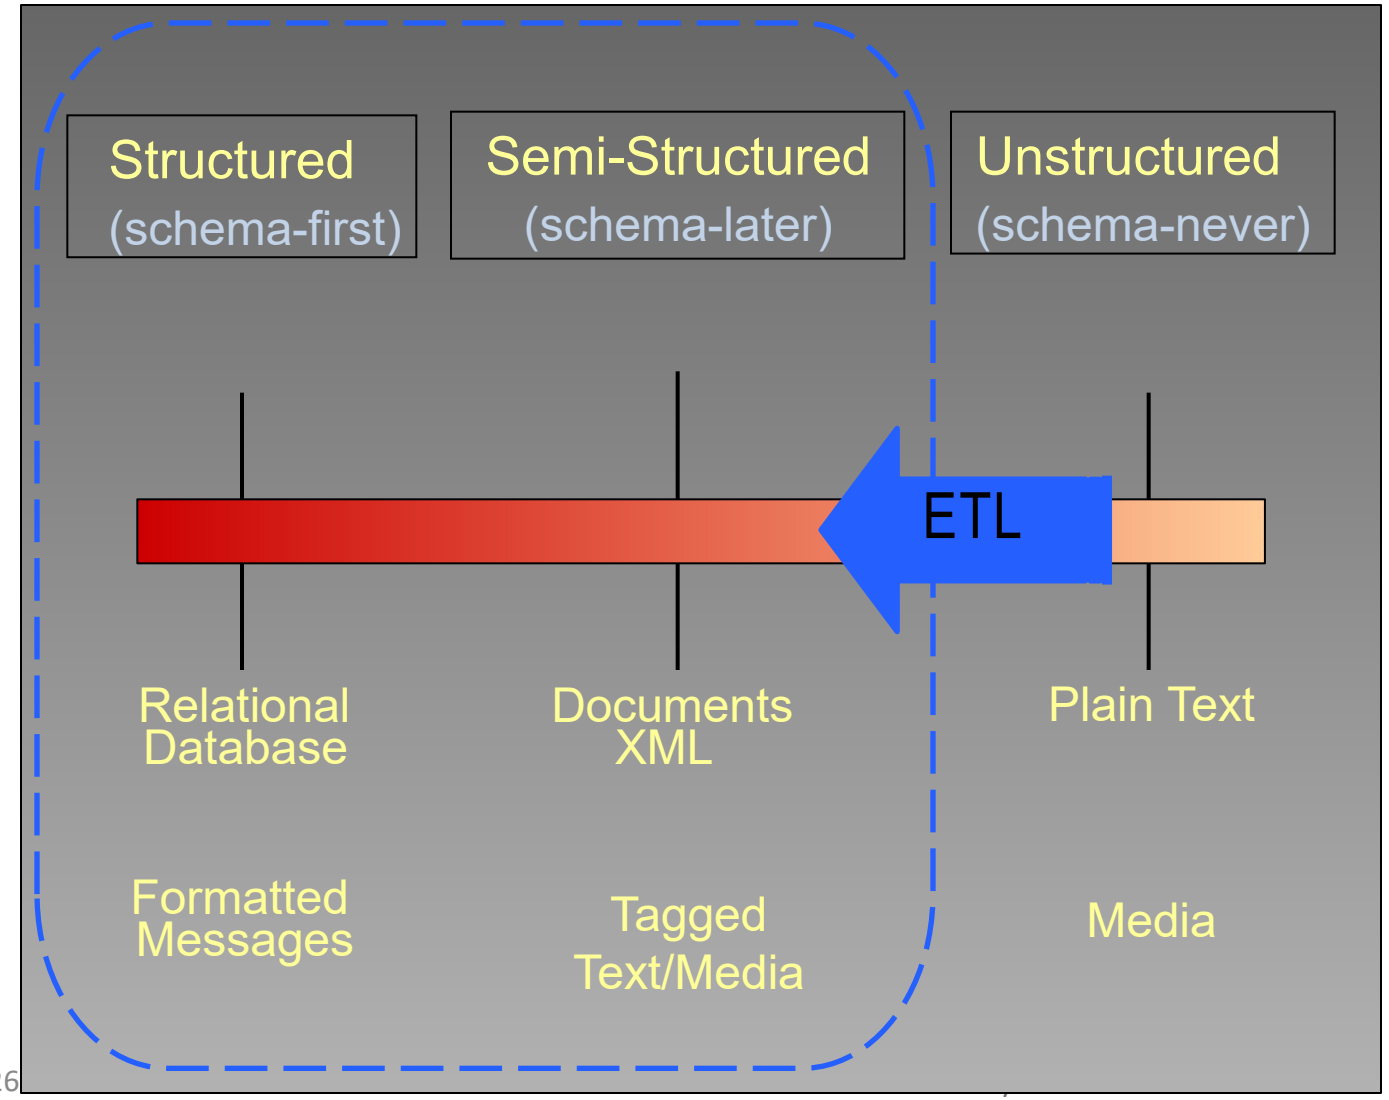




- Note: File formats ≠ data structure

https://cdn.wccftech.com/wp-content/uploads/2019/11/YouTube-Redesign-2019-768x432.jpg
https://th.bing.com/th/id/OIP.MNR8Ck5DWZb32tkqOfLuXAAAAA?rs=1&pid=ImgDetMain
https://files.codingninjas.in/article_images/preparation-guide-for-facebook-1-1662401488.webp

Traverse the Data Structure Spectrum



- Impose structure on unstructured data
  - Extract
  - Transform
  - Load

Traditional Analysis Tools

- Unix shell commands (awk, grep, ...)

```
root@nginx:~# awk ' {print $0}' file.txt
Item    Model    Country          Cost

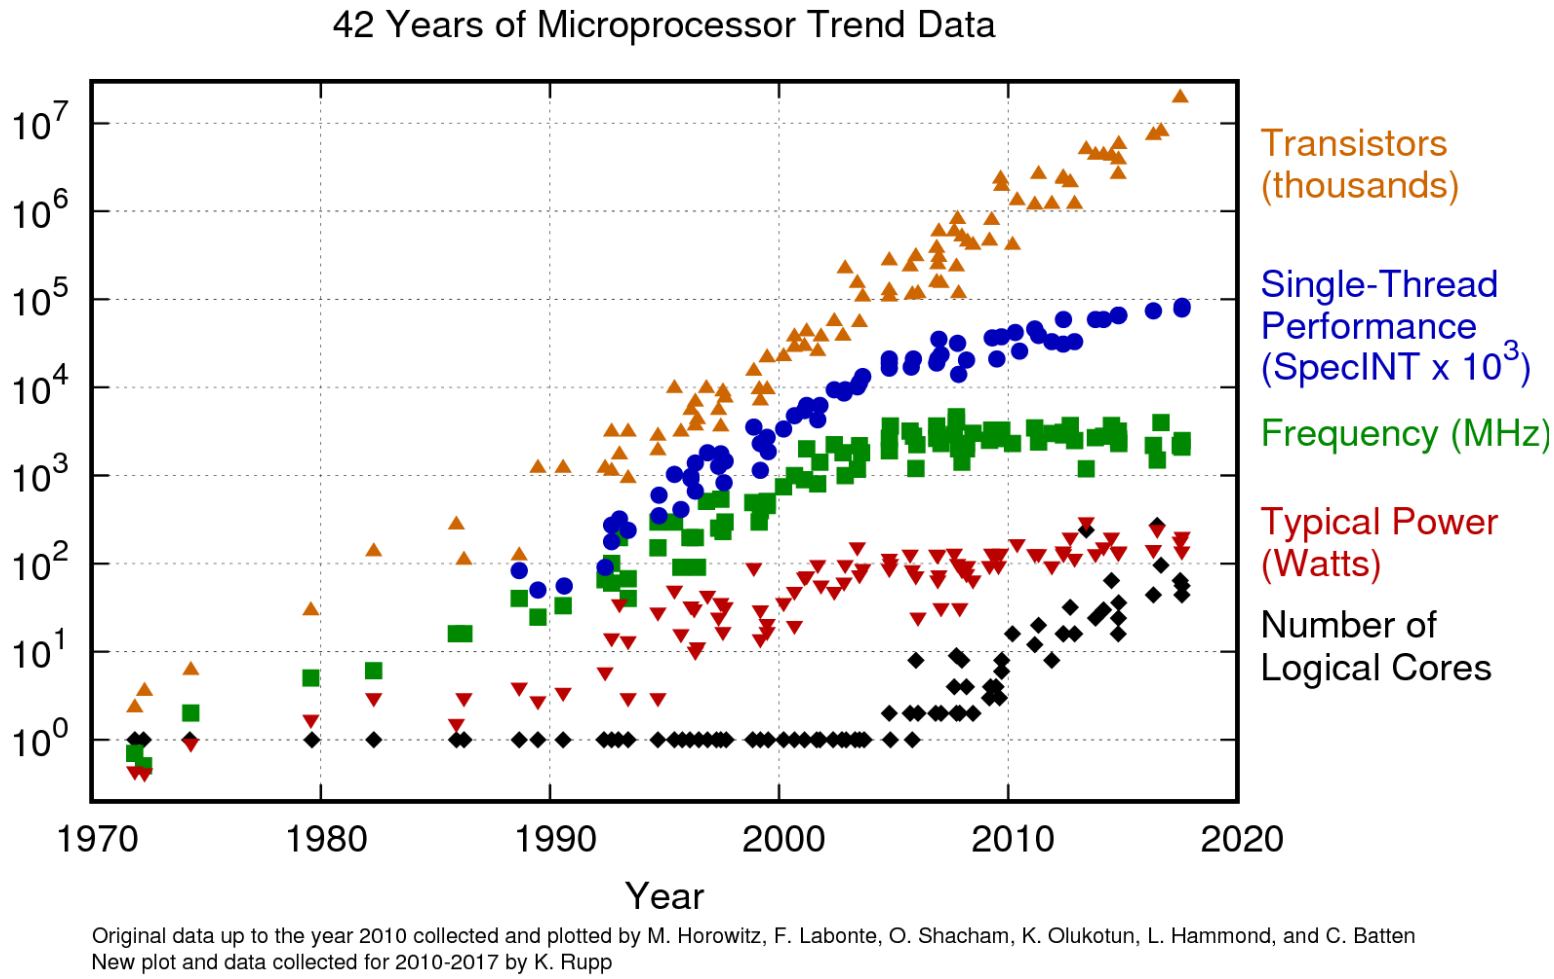
1       BMW      Germany          $25000
2       Volvo    Sweden           $15000
3       Subaru   Japan            $2500
4       Ferrari  Italy            $2000000
5       SAAB     USA              $3000
```

```
vulphere@arifuretaarch:~|⇒  grep root /etc/passwd
root:x:0:0:root:/root:/bin/zsh
vulphere@arifuretaarch:~|⇒  grep -n root /etc/passwd
1:root:x:0:0:root:/root:/bin/zsh
vulphere@arifuretaarch:~|⇒  grep -c false /etc/passwd
3
vulphere@arifuretaarch:~|⇒  _
```

All run on a single machine!

The Big Data Problem

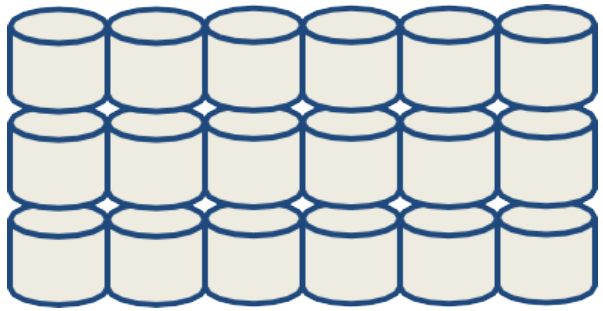
- Data growing faster than computation speeds
- Growing data sources
  - Web, mobile, scientific, …
- Storage getting cheaper
- But, stalling CPU speeds and storage bottlenecks



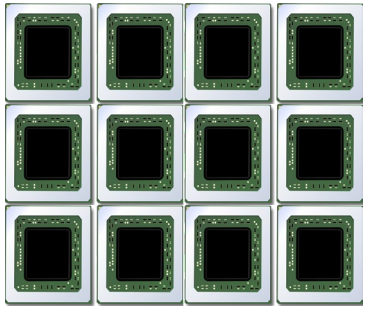
Original data up to the year 2010 collected and plotted by M. Horowitz, F. Labonte, O. Shacham, K. Olukotun, L. Hammond, and C. Batten
New plot and data collected for 2010-2017 by K. Rupp

Solution for the Big Data Problem

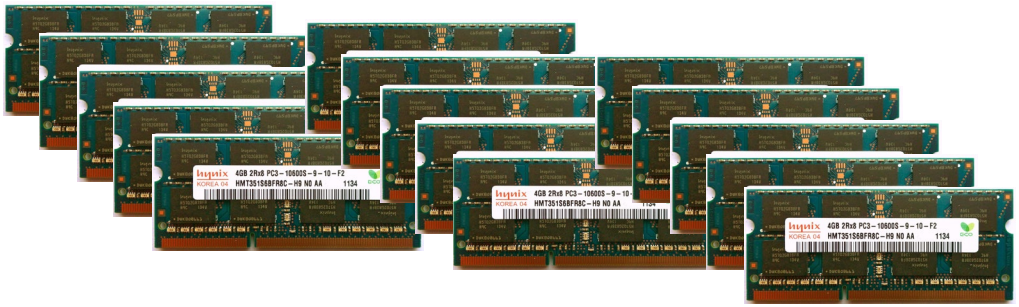
- One machine cannot process or *even store* all the data!
- Solution: **distribute** data over a **cluster** of machines



Lots of hard drives



… and CPUs



… and memory!

Solution in this module

"Apache Spark is an industry-leading platform for distributed extract, transform, and load (ETL) workloads on large-scale data."

– NVIDIA Technical Blog, Jun 12, 2023

Contents

- The Big Data Problem: Why Spark?
- **What is Spark?: The Essentials**
- An Example of Spark: Log Mining
- How to Use Spark: PySpark, HPC, Resources

Check-in code:
XX-XX-XX

Apache Spark

- Fast and general cluster computing system
- Interoperable with

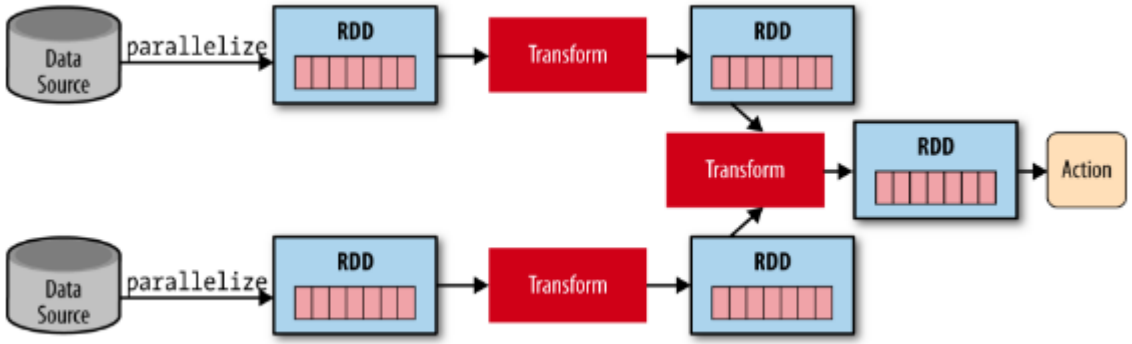
- Improves efficiency through:
  - In-memory computing primitives
  - General computation graphs
- Improves usability through:
  - Rich APIs in Scala, Java, Python
  - Interactive shell

→ Up to 100× faster (2-10× on disk)

→ 2-5× less code

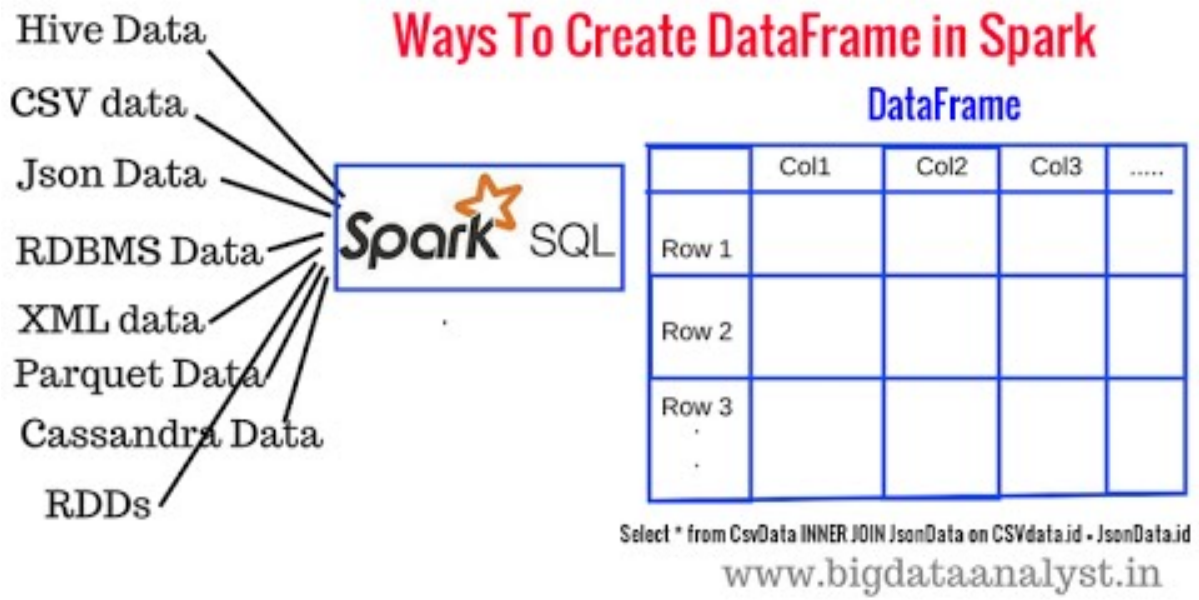
Spark Model

- Write programs in terms of transformations on distributed datasets
- Resilient Distributed Datasets (RDDs)
  - Collections of objects that can be stored in memory or disk across a cluster
  - Parallel functional transformations (map, filter, …)
  - Automatically rebuilt on failure



Spark for Data Science

- DataFrames
  - Structured data (SQL)
  - Familiar API based on R/Python Pandas
  - Distributed, optimised implementation



- Machine learning pipelines
  - Simple construction and tuning of ML workflows

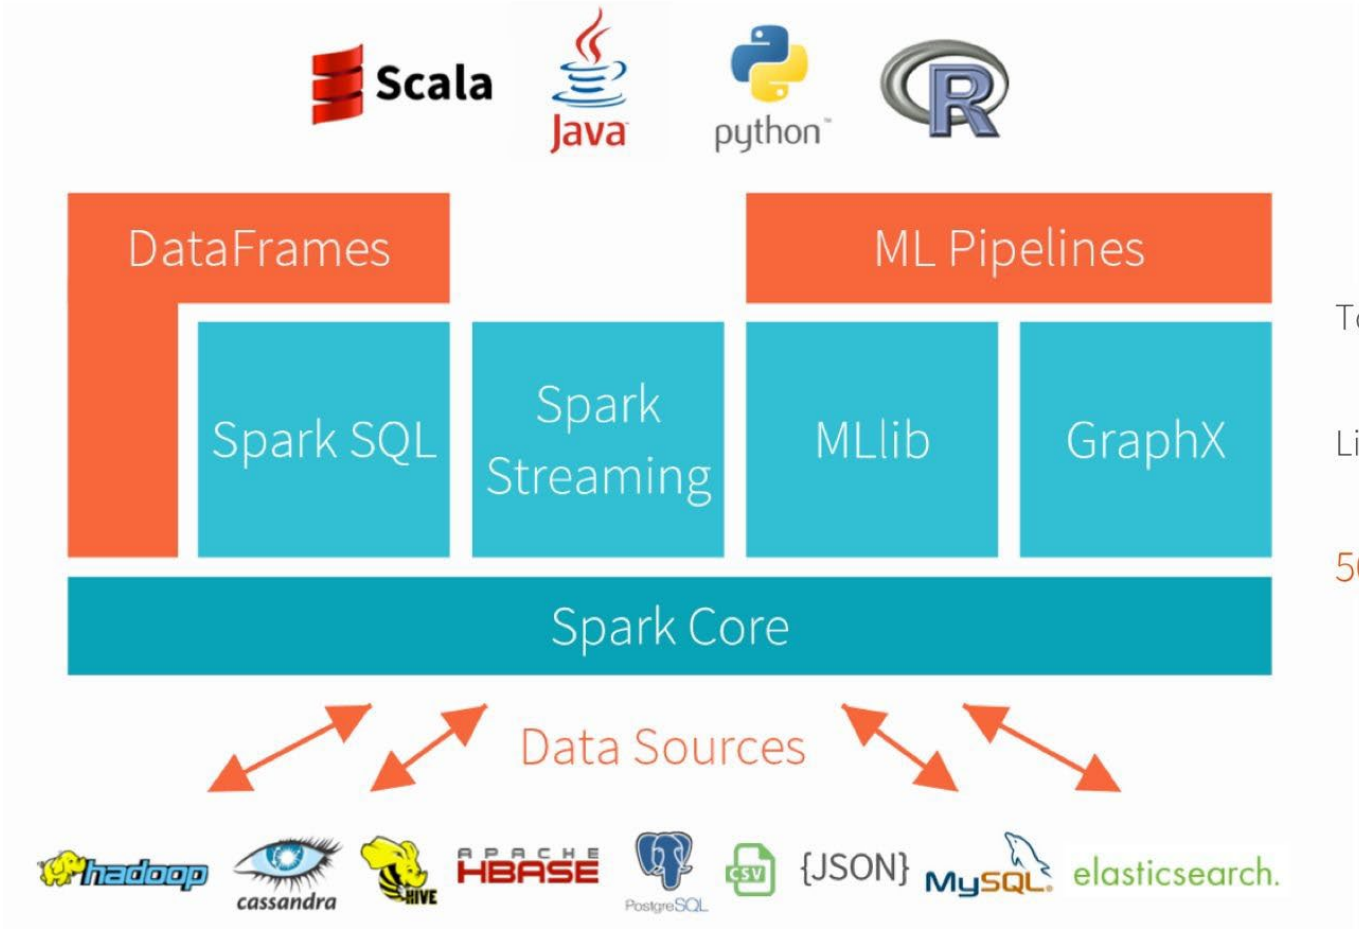
Spark Computing Framework

- Programming abstraction and parallel runtime to hide complexities of **fault-tolerance** and **slow** machines

"Here's an operation, run it on all of the data"

- Don't care where it runs (you schedule that)
- In fact, feel free to run it twice on different nodes (e.g. when it fails)

Apache Spark Ecosystem



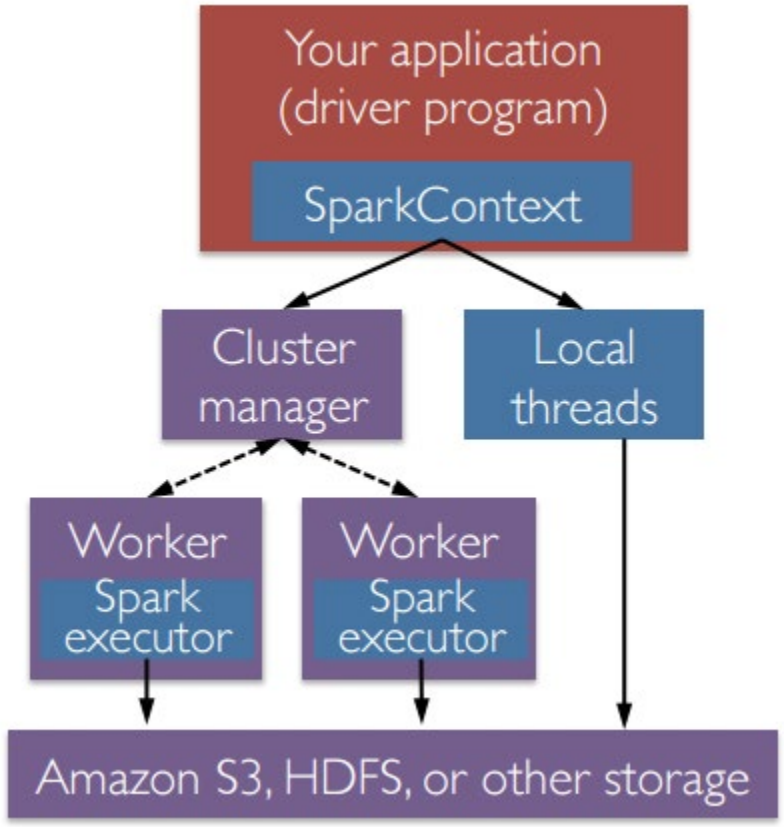
Total contributors: 150 → 500

Lines of code: 190K → 370K

500+ active production deployments

https://i.pinimg.com/originals/e7/f3/2d/e7f32d041846a5938a09e192bdf3885d.jpg

Spark Components



- A Spark program first creates a **SparkSession** object as the driver (including **SparkContext**)
  - Tells Spark how/where to access a cluster
  - Connect to cluster managers
- Cluster managers
  - Allocate resources across applications
- Spark executor (worker):
  - Access data storage
  - Run computations

SparkSession and SparkContext

- **SparkSession**
  - Entry point for DataFrame API, create DataFrames
  - PySpark shell automatically create SparkSession as spark
  - Programs: must create a new SparkSession first (see lab)
- **SparkContext**
  - Entry point for Spark functionality, create RDDs
  - Connect to a Spark cluster
  - Associated with a SparkSession
  - PySpark shell automatically create SparkContext as sc
  - Programs: sc = spark.sparkContext

The '*Master*' Parameter for a SparkSession

- Determines cluster type and size

Master Parameter	Description
local	run Spark locally with one worker thread (no parallelism)
local[K]	run Spark locally with K worker threads (ideally set to number of cores)
spark://HOST:PORT	connect to a Spark standalone cluster; PORT depends on config (7077 by default)
mesos://HOST:PORT	connect to a Mesos cluster; PORT depends on config (5050 by default)

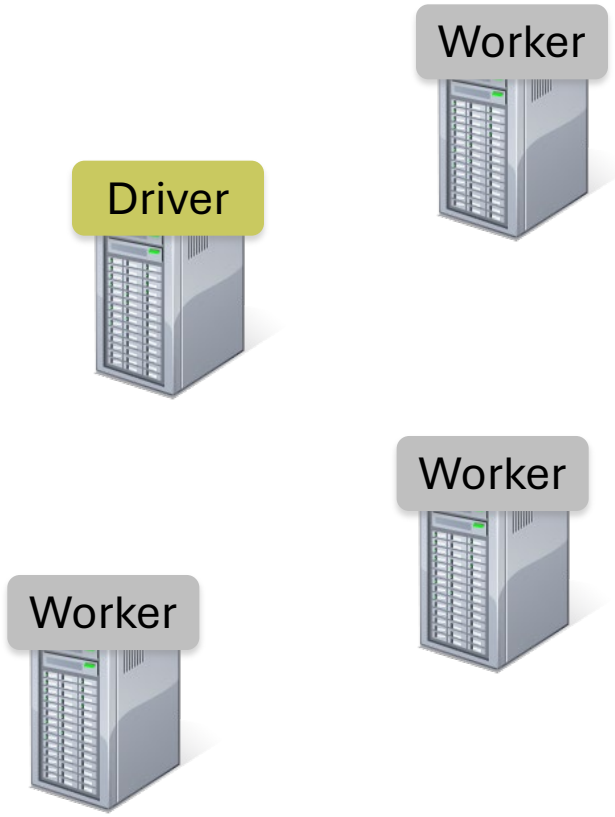
Spark Example: Log Mining (w/t RDD)

Load error messages from a log into memory, then interactively search for various patterns

Spark Example: Log Mining

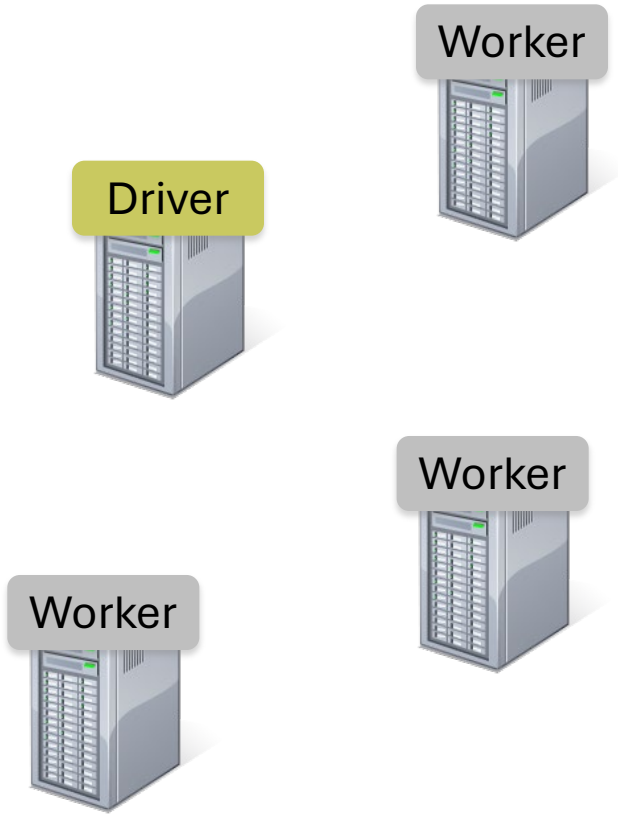
Load error messages from a log into memory, then interactively search for various patterns



Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

```
lines = spark.textFile(“hdfs://...”)
```

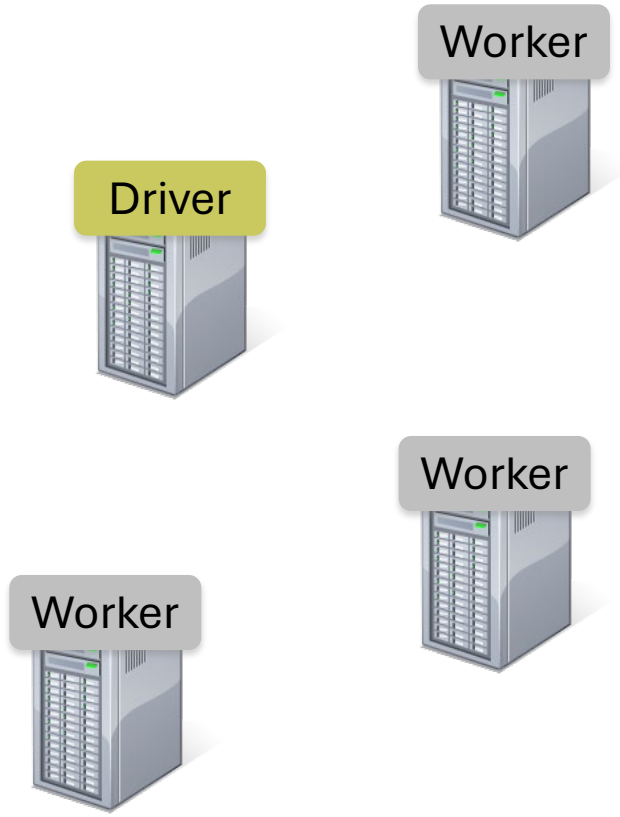


Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

Base RDD

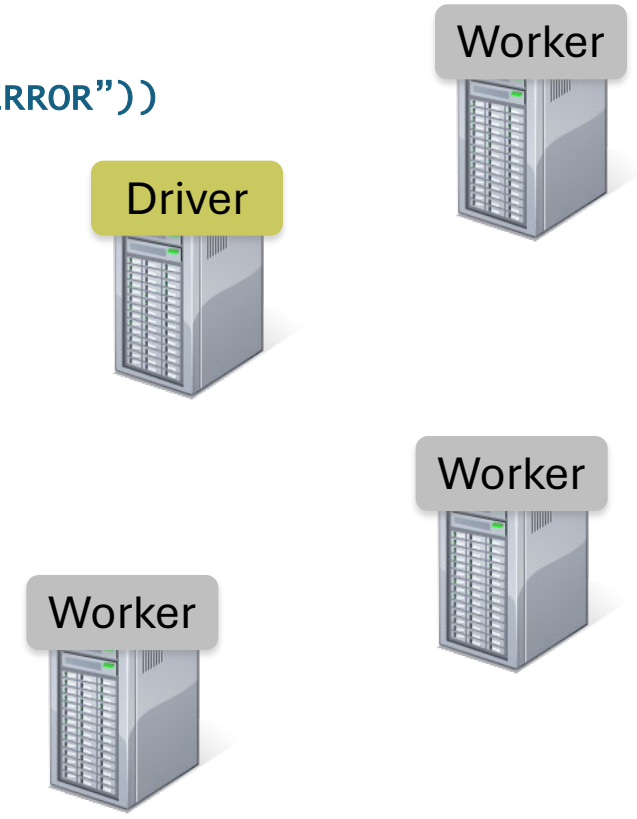
```
lines = spark.textFile("hdfs://...")
```



Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

```
lines = spark.textFile(“hdfs://...”)
errors = lines.filter(lambda s: s.startswith(“ERROR”))
```

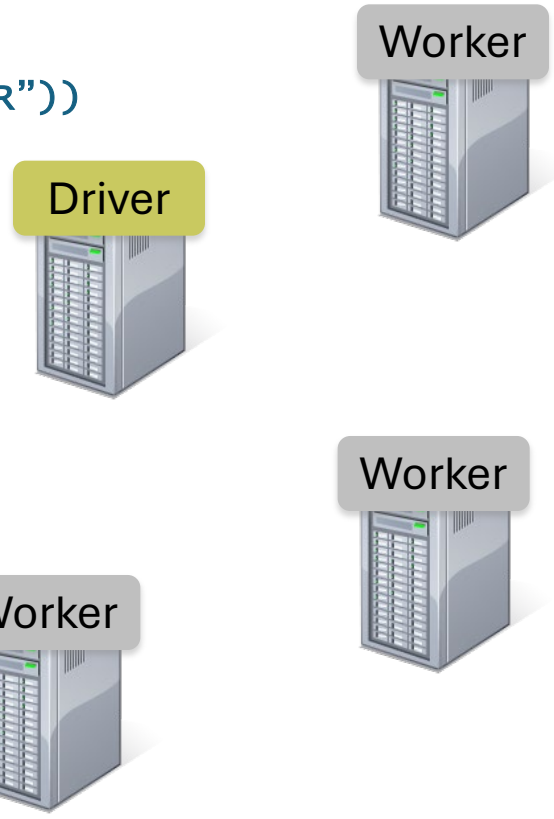


Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

Transformed RDD

```
lines = spark.textFile("hdfs://...")
errors = lines.filter(lambda s: s.startswith("ERROR"))
```

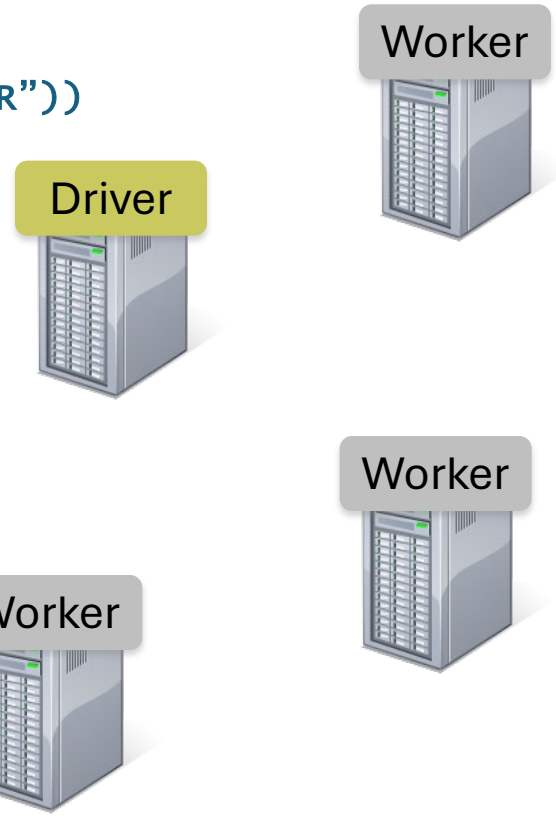


Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

```
lines = spark.textFile(“hdfs://...”)
errors = lines.filter(lambda s: s.startswith(“ERROR”))
messages = errors.map(lambda s: s.split(“\t”)[2])
messages.cache()

messages.filter(lambda s: “mysql” in s).count()
```

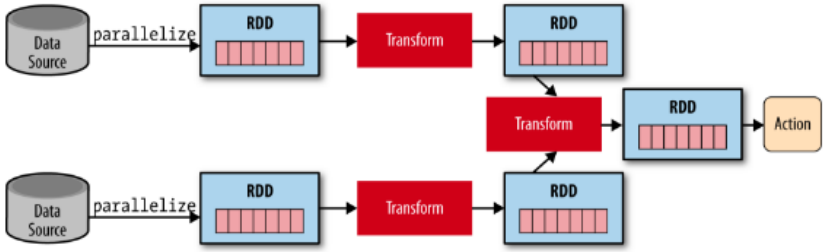


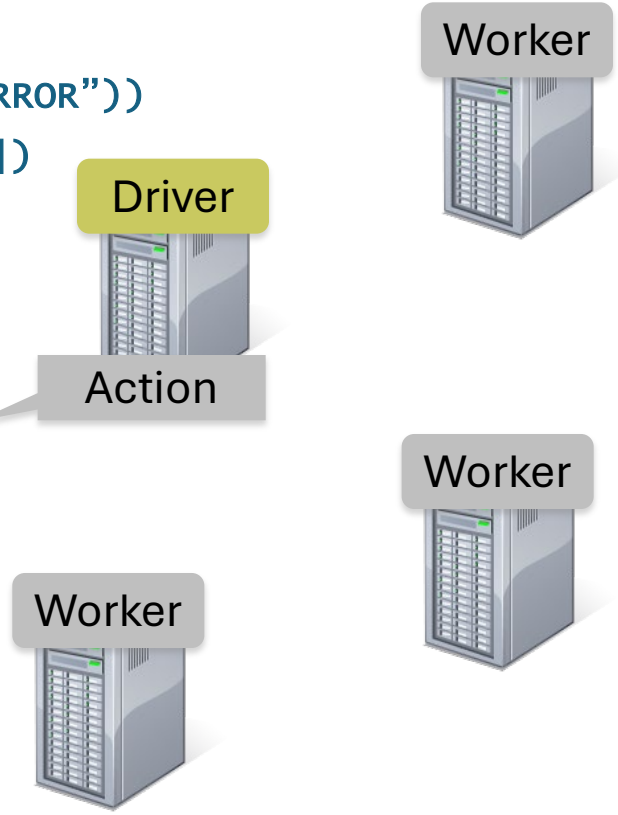
Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

```
lines = spark.textFile(“hdfs://...”)
errors = lines.filter(lambda s: s.startswith(“ERROR”))
messages = errors.map(lambda s: s.split(“\t”)[2])
messages.cache()
```

```
messages.filter(lambda s: “mysql” in s).count()
```



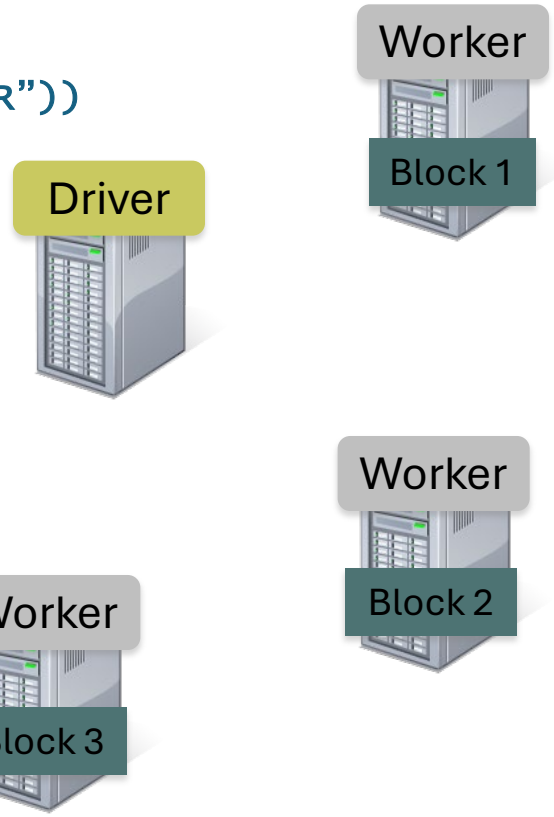


Spark Example: Log Mining

Load error messages from a log into memory, then interactively search for various patterns

```
lines = spark.textFile(“hdfs://...”)
errors = lines.filter(lambda s: s.startswith(“ERROR”))
messages = errors.map(lambda s: s.split(“\t”)[2])
messages.cache()

messages.filter(lambda s: “mysql” in s).count()
```



Spark Example: Log Mining

```
messages.filter(lambda s: “mysql” in s).count()
messages.filter(lambda s: “php” in s).count()
```

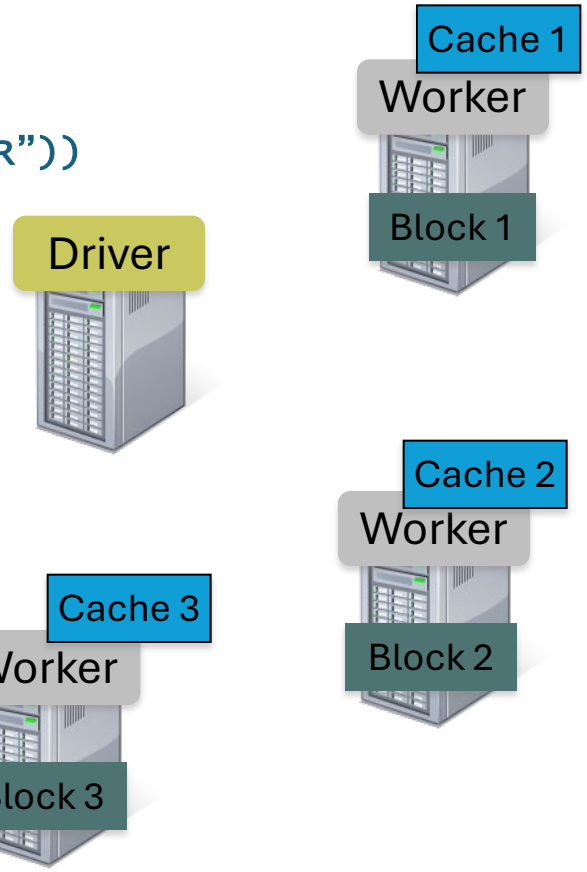
Cache your data ➔ Faster results
Full-text search of Wikipedia
- 60GB on 20 EC2 machines
- 0.5 sec from mem vs. 20s for on-disk



Spark Program Lifecycle

- Create DataFrames from external data or create DataFrame from a collection in a driver program
- Lazily transform them into new DataFrames
- cache( ) some DataFrames for reuse
- Perform actions to execute parallel computation and produce results

Use Spark Transformations and Actions wherever possible: Search DataFrame reference API

Check-in code: XX-XX-XX

PySpark 3.5.4

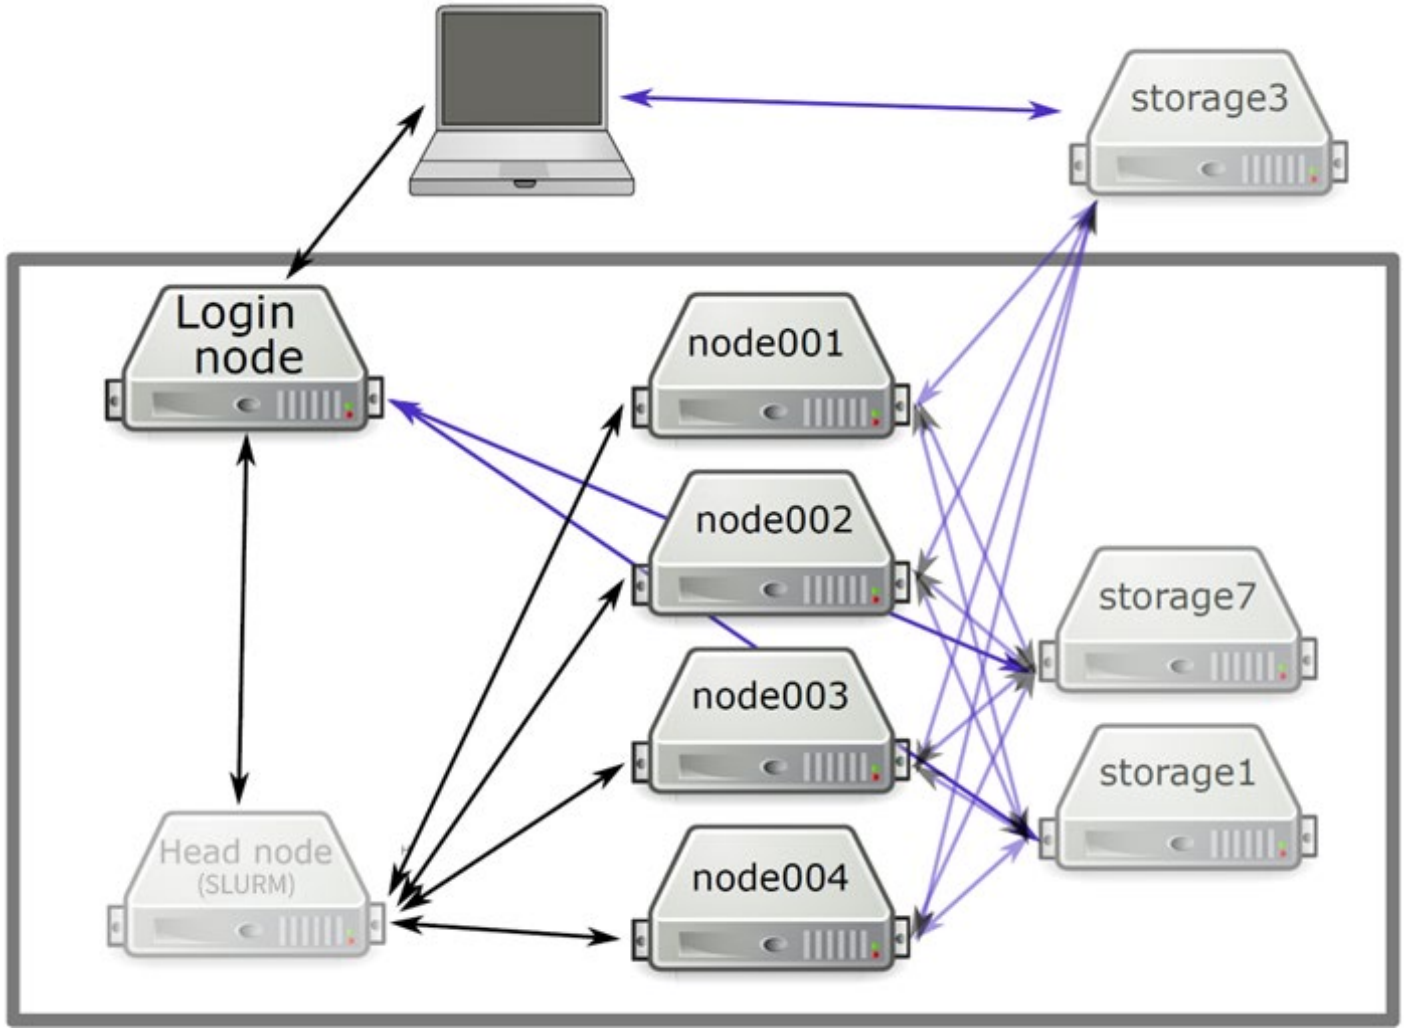
- Need: Java, Python, Spark
- See lab 1 on how to install on HPC
- To install on Windows (optional)
  - Lab 1 instructions: Install Java JRE, Python, Spark
  - Or pip install pyspark==3.5.4
- To install on Linux/Mac (optional): see lab references

University of Sheffield's HPC

STANAGE

- Account created for you already!
- Training (due 13th Feb Thursday-AS0): HPC Driving License test
- SSH access via stanage.sheffield.ac.uk
  - Windows: MobaXTerm
  - Linux/MAC OS: terminal (command line)
- VPN: a **MUST** for when connecting on campus using Eduroam or off campus

HPC Cluster Structure



Storage

Location	Quota	Speed	Suitable for?
/users/$USER	50GB	>	Personal data
/mnt/parscratch/	No limits	>>>	Temporary large files
/tmp	No limits	>>>	Temporary lots of small files

More information available at: https://docs.hpc.shef.ac.uk/en/latest/hpc/filestore.html

Interactive Session

```
Python 3.13.5 | packaged by Anaconda, Inc. | (main, Jun 12 2025, 16:09:02) [GCC 11.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
WARNING: Using incubator modules: jdk.incubator.vector
Using Spark's default log4j profile: org/apache/spark/log4j2-defaults.properties
Setting default log level to "WARN".
To adjust logging level use sc.setLogLevel(newLevel). For SparkR, use setLogLevel(newLevel).
26/02/03 14:52:48 WARN NativeCodeLoader: Unable to load native-hadoop library for your platform... us

     / __/__  ___ _____/ /__
    _\ \/ _ \/ _ `/ __/  '_/
   /__ / .__/\_,_/_/ /_/\_\   version 4.1.0
      /_/

Using Python version 3.13.5 (main, Jun 12 2025 16:09:02)
Spark context Web UI available at http://node001.pri.stanage.alces.network:4040
Spark context available as 'sc' (master = local[*], app id = local-1770130369562).
SparkSession available as 'spark'.
>>>
```

Batch Session – Shell Script xx.sh

Create a file `Lab1_SubmitBatch.sh`

```
#!/bin/bash
#SBATCH --time=00:30:00  # Change this to a longer time if you need more time
#SBATCH --nodes=1  # Specify a number of nodes
#SBATCH --mem=4G  # Request 4 gigabytes of real memory (mem)
#SBATCH --output=./Output/COM6012_Lab1.txt  # This is where your output and errors are logged
#SBATCH --mail-user=username@sheffield.ac.uk  # Request job update email notifications

module load Java/17.0.4
module load Anaconda3/2024.02-1

source activate myspark

spark-submit ./Code/LogMiningBig.py
```

Batch Session: Submit & Relax

- sbatch your job (can run at the login node): see Lab 1
- Then?
  - Close the terminal and leave
  - Wait for pre-set email notification
  - Check status: squeue
  - Cancel job: scancel
- How much resources to request
  1. Run short test jobs
  2. View resource utilisation
  3. Extrapolate
  4. Submit larger jobs

Summary of key concepts

Data structure spectrum	Structured, semi-structured, unstructured data, schema, ETL
Spark's computing model and framework	RDDs, DataFrames, parallel transformation, fault-tolerance, …
Components and lifecycle of a spark programme	SparkSession and SparkContext Creating DataFrames, lazy transformations, caching, and actions
Key features of the Stanage cluster	HPC structure, storage, interactive vs. batch session

Spark Resources

- Apache Spark open-source repository
- Apache Spark Documentation
- Learning Apache Spark with Python (Chapters 2 and 4)
- Suggested reading in labs

Suggested reading:

- Spark Overview
- Spark Quick Start (Choose **Python** rather than the default *Scala*)
- Chapters 2 to 4 of PySpark tutorial (several sections in Chapter 3 can be safely skipped)
- Reference: PySpark 4.1.0 documentation
- Reference: PySpark source code

Acknowledgements

- Some slides (sec. 1) are modified from the "Introduction to Apache Spark" course by Prof. A. D. Joseph, University of California, Berkeley.
- This module benefits from many open resources. See the acknowledgement on our GitHub page.
- There are many other resources that I have consulted but may somehow lost track of the origins.
